

# Process Analysis: AI- Outbound IVR

## 1. Process Identification

- **Process Name:** AI - Outbound IVR (Customer Appointment Management)
- **Product Overview:** Contact Center AI (VoiceGPT)
- **Process Goal/Objective:** To manage customer appointments efficiently, including confirmation, cancellation, and rescheduling, and ensure appropriate follow-up actions for unconfirmed appointments.

## 2. Process Scope

- **Start Point:** "Start" - Initiation of an outbound IVR message for appointment management.
- **End Point:** Various end points, including successful appointment confirmation, cancellation, or escalation to the "installation process" or sales.
- **In-Scope Activities:** Appointment message sending, customer interaction (confirm/cancel/reschedule), internal processing of responses, handling of no-answer scenarios, and escalation to installation or sales.
- **Out-of-Scope Activities:** The detailed "installation process" itself, initial appointment scheduling (before the IVR outbound message), and the specifics of "All call messages...reflected to FSM."

## 3. Process Description

- **Current State Narrative:** The process begins with an outbound IVR message regarding an appointment. Customers can choose to confirm, cancel, or reschedule. The system handles responses, escalates to "installation process" upon confirmation, or routes to sales/rejects orders for unconfirmed cases.
- **Key Steps/Activities (Sequential List):**
  - **Step 1: Start & Appointment Message Outbound:** The process begins, and an outbound IVR message is sent for an appointment.
  - **Step 2: Customer Response Awaiting:** The system awaits customer interaction (Confirm, Cancel, Reschedule).
  - **Step 3: Decision - Customer Action:**

- **If Confirmed (C):** Proceeds to the "installation process".
- **If Canceled (CA):** The process ends for this appointment.
- **If No Response:** The system checks for "number of calls for next-day appointments".
  - *Sub-step:* If there is no answer after 3 days of calls, the order is rejected to sales.
  - *Sub-step:* If "Customer Alt" is reached, it leads to a "Contact" step and potentially an "installation process" if confirmed, or rejection of sales.
- **Step 4: Reschedule Path:** If a customer chooses to reschedule ("CA" with a path back), the process loops back to a state that likely involves sending a new appointment message or handling the reschedule request.
- **Step 5: FSM Reflection:** "All call messages" need to be "reflected to FSM in all stages."
- **Roles and Responsibilities:**
  - **IVR System:** Sends messages, interprets responses, routes actions.
  - **Customer:** Responds to IVR (confirm, cancel, reschedule).
  - **Sales:** Receives rejected orders.
  - **FSM (Field Service Management?):** System where call messages are reflected.
- **Systems/Tools Used:** Outbound IVR system, FSM system.
- **Documents/Forms Used:** Appointment data.
- **Key Inputs:** Initial appointment schedule, customer contact information.
- **Key Outputs:** Confirmed appointments (leading to installation), canceled appointments, rejected orders for sales, rescheduled appointment requests.
