

Process Analysis: Outbound WhatsApp- AI (Appointment/Order Management)

1. Process Identification

- **Process Name:** Outbound WhatsApp - AI (Appointment/Order Management)
- **Product Overview:** Contact Center AI (VoiceGPT) & WhatsApp integration.
- **Process Goal/Objective:** To proactively manage customer appointments or order stages via outbound WhatsApp messages, allowing customers to confirm, reschedule, or cancel, and ensuring appropriate follow-up actions for unconfirmed interactions.

2. Process Scope

- **Start Point:** "Start" - Initiation of an outbound WhatsApp message.
- **End Point:** "End-Event" - Successful confirmation/rescheduling/cancellation, or exhaustion of contact attempts leading to a defined resolution.
- **In-Scope Activities:** Sending outbound WhatsApp messages, receiving customer responses (confirm, reschedule, cancel), handling no-response scenarios, generating follow-up calls, and updating order/appointment status.
- **Out-of-Scope Activities:** The detailed "start installation process" or "MCS Theaters" beyond their direct interaction with this outbound process.

3. Process Description

- **Current State Narrative:** The process begins by sending an outbound WhatsApp message to the customer, likely regarding an order stage or appointment. If the message is received, the system waits for a customer response (Yes/No). If there's no immediate response, "Generate 3 configurable calls per Slot" are initiated. The system manages confirmations, rescheduling, and cancellations, with specific paths for each. Unanswered messages lead to further actions.
- **Key Steps/Activities (Sequential List):**
 - **Step 1: Order Stage in FSM:** Input "Customer has WhatsApp". "Customer does not have WhatsApp" Which means customer has appointment "Excluding **mystc** orders"
 - **Step 2: Start & Message Outbound:** The process begins by sending a "Message" via WhatsApp to the customer regarding an "appointment".

- **Step 3: Message Received Check:** A decision point verifies if the "Message received?".
 - **If No:** The process loops back or proceeds to "WhatsApp CP if there is no interaction within a period of time" (implied loop/follow-up).
 - **If Yes:** Proceeds to wait for customer response.
- **Step 4: Technical push the call button (outbound) for Customer Response (Yes/No):**
 - **If Yes (Confirm):** Leads to "Approved", which then leads to "start installation process" or "MCS Theaters".
 - **If No (Reschedule/Cancel):**
 - **Reschedule:** Leads to "Reschedule", potentially offering "Same day" rescheduling or "Next day/Next Slots". The flow suggests a path involving "Customer" and then "Held stage".
 - **Cancel:** Leads to "Cancel".
- **Step 5: No Direct Response/Follow-up (Implied path from "No" on "Message received?"):** Leads to "Generate 3 configurable calls per Slot".
 - If these calls don't result in contact or confirmation ("No Answer"), it proceeds to "Want to cancel" or a decision point.
 - If "Want to cancel", it leads to "Cancel" the process.
 - If there's an "Answer", it can lead to "Customer" interaction.
- **Step 6: Held Stage Management:** From "Same day" rescheduling, it can lead to a "Held stage". ¹⁴If not the "Same day", it suggests a path to "24 hrs. If next day app not confirmed in the system, it should be re-assigned to the next available agent." From "Held stage", a decision point "Is call step?" (implied check for call follow-up). If "Yes", it leads to "End-Event". If "No", it loops back or leads to another "Held stage" for further action.
- **Step 7: End Event:** The process concludes at various points after successful resolution (confirmation, cancellation) or defined follow-up.
- **Roles and Responsibilities:**
 - **AI/System:** Sends WhatsApp messages, interprets responses, generates calls, manages flow logic, updates status.
 - **Customer:** Responds to messages, confirms/reschedules/cancels.

- **Agent (Implied):** For cases where an appointment is not confirmed within 24 hours.
- **Systems/Tools Used:** Outbound WhatsApp messaging platform, AI for interaction, call generation system, underlying order/appointment management system (FSM).
- **Documents/Forms Used:** Order status, appointment details.
- **Key Inputs:** Order stage updates, scheduled appointments, customer contact information.
- **Key Outputs:** Confirmed/rescheduled/canceled appointments/orders, initiated follow-up calls, updated order/appointment status.
