

Process Analysis: AI Inspection Process

1. Process Identification

- **Process Name:** AI Inspection Process
- **Product Overview:** AI to Perform Auto-Inspection (AI ChatBox)
- **Process Goal/Objective:** To ensure successful and quality installation by integrating AI-powered automated inspection, facilitating rework when necessary, and obtaining supervisor validation.

2. Process Scope

- **Start Point:** "Start Event" - Technician dispatched and preparing for installation.
- **End Point:** "End Event" - Inspection results reflected to FSM, and task completed.
- **In-Scope Activities:** Technician dispatch and preparation, network readiness check, AI auto-inspection, inspection result reflection, technician notification for failures, supervisor task validation, and acceptance of completion.
- **Out-of-Scope Activities:** The detailed "MSTC Sub-Process", the "existing installation process" details, and the specifics of "STC governance" assignment.

3. Process Description.

- **Current State Narrative:** The process begins with a technician preparing for installation. After checking network readiness, if ready, the existing installation process is followed. If not, the "MSTC Sub-Process" is invoked. Post-installation (or potentially post-MSTC), an AI system performs an auto-inspection. The inspection results are either passed to FSM for task completion or, if failed, the technician is notified for rework. Failed inspections are tracked by a configurable counter, and if it's not the first failure, a supervisor validates the technician's task before completion can be accepted.
- **Key Steps/Activities (Sequential List):**
 - **Step 1: Start & Technician Preparation:** The process starts with a technician dispatched and preparing for installation
 - **Step 2: Network Readiness Check:** A decision point checks if the "Network ready for installation??"
 - **If Yes:** "follow existing installation process"
 - **If No:** Proceeds to "MSTC Sub-Process"

- **Step 3: AI Auto-Inspection:** AI performs auto-inspection of installation activity
 - *Inspection Criteria:* Includes photos and configurable line parameters. Auto-inspection is configurable (On/Off) and needs to be enabled at selectable FDT/Zone/District/region/Kingdom levels
- **Step 4: Inspection Process Decision:** "inspection process?"
 - **If Pass:** "Reflect inspection results to FSM and proceed to complete the task", leading to "End Event"
 - **If Fail:**
 - Step 4a: Failed First Time? Check: A decision point "failed first time?" with a "configurable counter"
 - **If Yes:** "Reflect inspection results to FSM, notify technician with the failed parameters to fix them. This loops back to the beginning of the "AI to perform Auto-inspection" step (implied by connector A).
 - **If No:** "validate technician task.
 - *Supervisor Notification:* Notify supervisor via SMS.
 - *Configurable Task:* It is a configurable task and can be assigned to STC governance.
 - *Request Open:* Request still open until this task is completed.
 - Step 4b: Accept Completion? (Supervisor): Supervisor decides to "Accept completion?"
 - **If Yes:** Leads to "End Event" (implied, as the task is completed).
 - **If No:** Loops back to the beginning of the "AI to perform Auto-inspection" step (implied by connector A).
- **Roles and Responsibilities:**
 - **Technician:** Dispatched, prepares for installation, performs installation, fixes failed parameters.
 - **AI+ System:** Performs auto-inspection of installation activity, reflects inspection results to FSM.

- **Supervisor:** Validates technician task, accepts completion.
- **Systems/Tools Used:** AI+ system, FSM (Field Service Management), configurable counter.
- **Documents/Forms Used:** Inspection results (including photos and line parameters).
- **Key Inputs:** Technician dispatch request, network readiness status, installation activity.
- **Key Outputs:** Inspection results (pass/fail), notification to technician, reflection to FSM, supervisor validation, completed task.
