

Process Analysis: Outbound with No Appointment- AI

1. Process Identification

- **Process Name:** Outbound with No Appointment - AI (Order Stage Management)
- **Product Overview:** Contact Center AI (VoiceGPT)
- **Process Goal/Objective:** To proactively manage customer orders that are in an FSM (Field Service Management) stage without a set appointment, by attempting to contact the customer, provide appointment options, or facilitate cancellation/rejection, ultimately staging the order for the next appropriate phase.

2. Process Scope

- **Start Point:** "Start" - An order is in an FSM stage with no appointment, or an appointment has expired.
- **End Point:** The process ends after setting an appointment, rejecting the order to sales, or proceeding with a retention process.
- **In-Scope Activities:** AI-driven outbound calls, checking for customer answers, handling maximum call attempts, offering appointment dates, managing reschedule/cancellation requests, and reflecting call logs and task statuses.
- **Out-of-Scope Activities:** The detailed "follow outbound call process" beyond this specific AI interaction, and the specifics of the "Retention Process By AI" beyond its triggering.

3. Process Description

- **Current State Narrative:** The process initiates for orders in FSM without appointments (e.g., expired appointments). An AI-powered Contact Center makes outbound calls to the customer. If the customer answers, they are given options to reschedule or cancel. If they don't answer after a maximum number of calls, the order is rejected to sales. If the customer requests to call again after the last call, the system can extend to generate one more call.
- **Key Steps/Activities (Sequential List):**
 - **Step 1: Start & Initial State:** The process begins with an order in FSM that has no appointment (e.g., appointment expired, M-CUS based on MCUST code).

- **Step 2: AI Initiates Outbound Calls:** "Contact center AI" initiates outbound calls. The AI is configured to "generate a 3 calls/day (configurable) in configurable time for day for 3 as existing."
- **Step 3: Call Logging:** For each call, the system should "reflect the call log and update task status."
- **Step 4: Customer Answer Check:** A decision point checks if "Customer Answer".
 - **If No:** Proceeds to "reach max calls" decision.
 - **If Yes (max calls reached):** "Reject sales with proper reason code."
 - **If No (max calls not reached):** Loops back to "Contact center AI" to generate more calls (implied by the flow from "No" to the Contact center AI).
 - **If Yes:** Proceeds to options for the customer (Reschedule/Cancel).
- **Step 5: Customer Options (Answered Call):**
 - **Reschedule:** If the customer chooses to "Reschedule", the AI is tasked to "provide available appointment date based on FSM appointment availability and then take action to stage the order to next stage." This leads to "set appointment" and then proceeds to "B" (implied next step in a broader process like "follow outbound call process").
 - **Cancel:** If the customer chooses to "Cancel", the AI performs "customer retention" by offering "immediate order Installation," asking for the reason for cancellation, and then acting to "reject the order." This leads to "Retention Process By AI."
- **Step 6: Call Again Request:** "If customer requests to call again and it was last call of the process then system needs to extend to generate one more call to the customer after 3 hours (configurable) or based on customer request time and it should not pass 24Hrs." This leads to "call again" and "Retention Process By AI."
- **Roles and Responsibilities:**
 - **AI (Contact Center AI):** Generates calls, logs call, offers appointment dates, manages rescheduling, performs retention, processes cancellations, rejects orders to sales.
 - **Customer:** Answers calls, requests rescheduling or cancellation, requests to be called again.

- **Sales:** Receives rejected orders.
 - **FSM (Field Service Management):** Provides appointment availability and is updated with order status.
- **Systems/Tools Used:** FSM, Contact Center AI for outbound calling, call logging system.
- **Documents/Forms Used:** Order status records, appointment availability data.
- **Key Inputs:** Order stage in FSM with no appointment (including expired appointments, M-CUS code), customer response to calls.
- **Key Outputs:** Set appointments, rejected orders to sales, updated call logs and task statuses, performed customer retention actions.
